

Vitamin Chart

Name	Function	Deficiency signs	Extra Clues	Toxicity/disease/other
	<ul style="list-style-type: none"> -Required by all animals -Exists as retinol, retinal, retinoic acid, and retinyl palmitate -Required for vision (rhodopsin → night vision) -Maintains epithelial tissues -Supports bone growth -Antioxidant role -First fat-soluble vitamin discovered 	<ul style="list-style-type: none"> -Night blindness -Keratinization of epithelial cells -Increased respiratory infections -Reproductive problems: <p>*Females: abortions, retained placentas, low calf vigor, blind calves</p> <p>*Males: decreased libido, poor sperm motility, degeneration</p>	<ul style="list-style-type: none"> -Main precursor: beta-carotene in plants -Conversion happens in small intestine mucosal cells -Absorption is energy dependent and transported to liver via lymphatics -Stored in Kupffer cells of the liver -All-trans form has highest biological activity 	<p>Safe upper level:</p> <ul style="list-style-type: none"> • Non-ruminants: 4–10 × requirement • Ruminants: 30–50 × requirement <p>Toxicity usually at ~1000 × requirement</p> <p>1,000,000 IU can be lethal in humans</p>
	<ul style="list-style-type: none"> -Raises blood calcium and phosphorus -Increases Ca & P absorption from the gut -Increases Ca & P release from bone -Stimulates Ca-binding protein -Helps phosphorus absorption in small intestine 	<ul style="list-style-type: none"> • Poor skeletal growth • Inadequate bone mineralization • Rickets (young animals) • Osteomalacia (adults) • Requirements rise with growth rate • True deficiency is rare in cattle due to sunlight exposure 	<ul style="list-style-type: none"> -Vitamin D2 = ergosterol in plants -Vitamin D3 = 7-dehydrocholesterol in animals -Sunlight activated -Active form is formed in liver and kidneys -Uptake is rapid in the duodenum, but most absorbed in jejunum and ileum 	<p>Calcification of soft tissues (kidney, liver, muscle)</p> <p>Very high doses (>1,000,000 IU/day) used briefly to prevent milk fever</p> <p>Excess levels can reduce feed intake</p>
	<ul style="list-style-type: none"> -Antioxidant — protects lipids in cell membranes from peroxidation -Prevents formation of free-radical peroxides that damage cells -Supports immune function (helps increase antibody production) -Works with selenium; 	<ul style="list-style-type: none"> -Reproductive failure -Cell membrane damage (deranged cell permeability) -Muscle lesions → myopathy / muscular dystrophy -White muscle disease -Mulberry heart disease (heart muscle degeneration) -Liver necrosis -Requirement increases when dietary PUFAs increase (more oxidation risk) 	<ul style="list-style-type: none"> -First identified as fat-soluble factor needed for normal reproduction in rats -Tocopherols absorbed in the jejunum by passive diffusion -Form micelles with bile salts for absorption -Placental transfer is very inefficient -Expensive and unstable 	<ul style="list-style-type: none"> • Very little toxicity reported • Generally considered the most tolerable of the fat-soluble vitamins

Vitamin Chart

	<p>Essential for blood clotting</p> <p>Acts as a cofactor for enzymes involved in prothrombin production</p>	<ul style="list-style-type: none"> • Increased clotting time • Higher risk of internal bleeding • Deficiency often linked to: <ul style="list-style-type: none"> ○ Feed additives that inhibit Vit K-producing bacteria ○ Housing systems (slotted floors, low manure contact) that reduce bacterial exposure 	<p>Forms:</p> <ul style="list-style-type: none"> • K1 (phylloquinone) — plant-derived • K2 (menaquinone) — produced by microbes • K3 (menadione) — synthetic form widely used <p>Significant bacterial synthesis in the rumen and some in large intestine</p>	<p>No toxicity mentioned for Vitamin K</p> <p>Sweet Clover Disease:</p> <ul style="list-style-type: none"> • Moldy sweet clover hay contains dicoumarol, a Vitamin K antagonist • Dicoumarol binds the same enzyme as Vitamin K but does not catalyze the reaction • Leads to internal bleeding and death in cattle • Dicoumarol and Warfarin (another antagonist) are active ingredients in rat poisons
	<p>Important in decarboxylation reactions (e.g., pyruvate → acetaldehyde + CO₂)</p> <p>High in whole grains</p>	<p>↑ Blood pyruvic & lactic acid</p> <p>Anorexia</p> <p>Polyneuritis (chickens: “star-gazing”/head retraction)</p> <p>Beriberi in humans (numbness, weakness, enlarged heart)</p>	<p>Thiamine</p> <p>Pigs store in tissues more than other species</p>	<p>PEM (Polioencephalomalacia)</p> <ul style="list-style-type: none"> -Seen in feedlot cattle after sudden diet changes → acidosis -Rumen bacteria produce thiaminase I & II → thiamin destruction -Causes blindness, convulsions, death -Treated with IV thiamin -High dietary sulfur risk factor
	<p>Component of FAD</p> <p>Involved in energy metabolism & electron transfer</p>	<p>Poor growth</p> <p>Poor appetite</p>	<p>Riboflavin</p>	<p>Requirement linked to energy metabolism & growth rate</p>

Vitamin Chart

	<ul style="list-style-type: none"> Structural component of NAD Needed for energy transfer, Krebs cycle, oxidative phosphorylation 	<p>Slow growth, poor appetite</p> <p>Pellagra: dermatitis, diarrhea</p> <p>Niacin in grains is unavailable to non-ruminants</p> <p>Can be synthesized from tryptophan</p>	Niacin	<p>Supplementation helps:</p> <ul style="list-style-type: none"> Dairy cattle (6–12 g/day) — reduces subclinical ketosis 6 g/day may increase milk production Useful in high-corn diets (feedlot, dairy, young calves)
	<p>Component of Coenzyme A</p> <p>Important in energy metabolism (Krebs cycle)</p>	<p>“Goose-stepping” gait (nerve damage)</p> <p>Hair loss</p> <p>Enteritis</p>	Pantothenic acid	
	<p>Coenzyme in protein and nitrogen metabolism</p> <p>Required for transamination reactions</p>	<ul style="list-style-type: none"> Nervous system disorders: convulsions, myelin sheath issues 	Pyridoxine	Low bioavailability in grains
	<p>Cofactor for several Krebs cycle enzymes</p> <p>Important for gluconeogenesis</p>	Scaly dermatitis	Biotin	Avidin in raw egg whites binds biotin & reduces availability
	<p>Methyl donor (CH₃)</p> <p>Needed to produce SAM</p> <p>SAM required for:</p> <ul style="list-style-type: none"> DNA synthesis Blood cell formation 	anemia	Folic acid	<ul style="list-style-type: none"> Requirement increases during pregnancy

Vitamin Chart

	<p>Converts precursors to TCA cycle intermediates</p> <p>Important in propionate metabolism</p> <p>Closely linked with folic acid</p>		Cyanocobalamin	<ul style="list-style-type: none"> Requires Intrinsic Factor (IF) for absorption B12-IF complex absorbed in small intestine Cattle need cobalt for rumen microbes to synthesize B12
			Adenine	
			Inositol	
			Para Amino Benzoic Acid	
			Salicyclic acid	
	<p>Involved in nerve transmission (acetylcholine)</p> <p>Component of phospholipids & cell membranes</p> <p>Involved in fat metabolism</p>			<p>Similar to B-vitamins</p> <p>Made in the liver</p> <p>Required in large amounts, especially for ruminants</p> <p>Choline chloride is hygroscopic → absorbs moisture → reduces vitamin stability</p>
	Required for collagen synthesis and metabolism	Scurvy (in species that require)		<p>Only humans, guinea pigs, and apes require it</p> <p>Domestic livestock do NOT have a dietary requirement</p>
